Question : How will I define the quality of a software?

Answer : Suppose I want to book a train ticket through the IRCTC application. To define the quality of the application, I will check different things such as:

- Whether the application is working properly without errors.
- Whether the ticket booking process is smooth and easy to understand.
- Whether the application loads quickly and responds fast.
- Whether payment transactions are secure.
- Whether the application provides accurate train and seat availability information.
- Whether the application works properly on different devices and browsers.

If the application fulfills my requirements, works reliably, is easy to use, secure, fast, and provides correct results without defects, then I will say that the quality of the software is good.

Similarly, software quality means the degree to which a software application meets user requirements, performs its intended functions correctly, remains reliable, secure, efficient, and provides a satisfactory user experience.
